(54) Postage metering system and method for automatic detection of remote postage security devices on a network

(57) A postage metering system (10) includes a plurality of printer modules (20, 22) connected as part of a network and operating as clients on the network. Postal security devices (40) (PSDs) are coupled the clients (20, 22). Each PSD (40) is local to the coupled client functioning as a host to the PSD and remote to the other of the plurality of clients. The PSD includes unique identification, postal value storage and a digital signature generator. The clients function as a postage metering network (10) wherein a client requests evidence of postage payment from a remote PSD (40) for concluding postage metering transactions. Each of the clients determines which of the remote PSDs are available for metering transactions on the network by broadcast mes-

sages and requests. In one embodiment, a broadcast request for the identity of remote PSDs whose host is logged onto the network is sent over the network by a client when the client logs onto the network. Additional broadcast requests are periodically sent over the network by the client to other clients logged onto the network. Broadcast messages indicating the unique identification of the PSD coupled to a host are sent over the network by the host when the host logs onto the network. Additional broadcast messages are sent periodically over the network by the host. Another broadcast message indicating that a PSD is no longer available is sent over the network by the host when it logs off the network. In alternate embodiments a network server controls broadcast requests and messages.

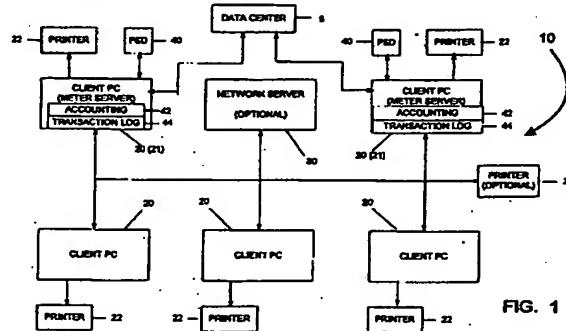

FIG. 1

Description

[0001] The present invention relates generally to a postage metering system and method for printing postage indicia using a personal computer and, more particularly, to a postage metering system and method for printing postage indicia in a network of personal computers.

[0002] The present application is related to the following European Patent Application Nos. (Client Ref.: E-644, E-646, E-647, E-648, E-649 and E-696), (Attorney Ref.: 76 354; 76 355; 76 395; 76 396; 76 356 and 76 398) all filed concurrently herewith and assigned to the assignee of the present invention.

[0003] The Information-Based Indicia Program ("IBIP") is a distributed trusted system proposed by the United States Postal Service ("USPS") to retrofit and augment existing postage meters using new technology known as information-based indicia. The program relies on digital signature techniques to produce for each envelope an indicium whose origin cannot be repudiated and content cannot be modified. IBIP is expected to support new methods of applying postage in addition to the current approach, which typically relies on a postage meter to mechanically print indicia on mailpieces. IBIP requires printing a large, high density, two-dimensional ("2-D") bar code on a mailpiece. The 2-D bar code encodes information and is signed with a digital signature.

[0004] The USPS has published draft specifications for IBIP. The INFORMATION BASED INDICIA PROGRAM (IBIP) INDICIUM SPECIFICATION, dated June 13, 1996, and revised July 23, 1997, ("IBIP Indicium Specification") defines the proposed requirements for a new indicium that will be applied to mail being processed using IBIP. The INFORMATION BASED INDICIA PROGRAM POSTAL SECURITY DEVICE SPECIFICATION, dated June 13, 1996, and revised July 23, 1997, ("IBIP PSD Specification") defines the proposed requirements for a Postal Security Device ("PSD") that will provide security services to support the creation of a new "information based" postage postmark or indicium that will be applied to mail being processed using IBIP. The INFORMATION BASED INDICIA PROGRAM HOST SYSTEM SPECIFICATION, dated October 9, 1996, defines the proposed requirements for a host system element of IBIP ("IBIP Host Specification"). The specifications are collectively referred to herein as the "IBIP Specifications". IBIP includes interfacing user (user), postal and vendor infrastructures which are the system elements of the program. The INFORMATION BASED INDICIA PROGRAM KEY MANAGEMENT PLAN SPECIFICATION, dated April 25, 1997, defines the generation, distribution, use and replacement of the cryptographic keys used by the USPS product/service provider and PSDs ("IBIP KMS Specification").

[0005] The user infrastructure, which resides at the user's site, comprises a PSD coupled to a host system ("Host") with printer. The PSD is a secure processor-

based accounting device that dispenses and accounts for postal value stored therein.

[0006] The IBIP Indicium Specification provides requirements for the indicium that consists of both human-readable data and PDF417 bar code data. The human-readable information includes an originating address, including the 5-digit ZIP Code of the licensing post office, PSD ID/Type number, date of mailing and amount of the applied postage. The bar code region of the indicium elements includes postage amount, PSD ID, user ID, date of mailing, originating address, destination delivery point identification, ascending and descending registers and a digital signature.

[0007] An integrated mailing system is subject to open system requirements if it includes a computer interfaced to the meter and it prepares mailpiece fronts or labels that include both the destination address and the indicium. The integrated system is an open system even if different printers apply the address and the indicium. If the mailing system satisfies such criteria, the USPS considers the "meter" to be an open system peripheral device that performs the dual functions of printing the indicia and interfacing the PSD to the Host. The integrated mailing system must be approved by the USPS according to open system criteria.

[0008] The IBIP Host Specification sets forth the requirements for a Host in an open system. The Host produces the mailpiece front including the return address (optional), the delivery address (required), the Facing Identification Mark ("FIM"), and the indicium as an integral unit. The Host may print this unit on the actual mailpiece stock or label(s) for later attachment to the mailpiece. The Host provides the user with an option to omit the FIM (e.g., when the FIM is preprinted on envelopes). The Host produces standardized addresses, including standard POSTNET delivery point bar code, for use on the mailpiece. The Host verifies each address at the time of mailpiece creation. The Host then creates the indicium and transmits it to the printer.

[0009] The IBIP Specifications define a stand-alone open metering system, referred to herein as a PC Meter or Stand-alone PC Meter. The Stand-alone PC meter has one personal computer ("PC") which operates as the Host ("Host PC"). The Host PC runs the metering application software and associated libraries (collectively referred to herein as "Host Applications" and "PC Meter Toolkit") and communicates with one or more attached PSDs. The Stand-alone PC Meter can only access PSDs coupled to the Host PC. There is no remote PSD access for the Stand-alone PC Meter.

[0010] The Stand-alone PC Meter processes transactions for dispensing postage, registration, and refill on the Host PC. Processing is performed locally between the Host and the PSD coupled thereto. Connections to a Data Center, for example for registration and refill transactions, are made locally from the Host through a local or network modem/internet connection. Accounting for debits and credits to the PSD are also performed

locally, logging the transactions on the Host PC, which is the PC where the transactions are processed on and to which the PSD is attached. Thus, the accounting of funds and transaction processing are centralized on a single PC. The Host PC may accommodate more than one PSD, for example supporting one PSD per serial port. Several applications programs running on the Host PC, such as a word processor or an envelope designer, may access the Host Applications.

[0011] The IBIP Specifications do not address an IBIP open metering system on a network environment. However, the specifications do not prohibit such a network-based system. Generally, in a network environment a network Server PC controls remote printing requested by a Client PC on the network. Of course, the Client PC controls any local printing.

[0012] One version of a network metering system, referred to herein as a "Virtual Meter", has many Host PCs without any PSDs coupled thereto. The Host PCs run client applications; but all PSD functions are performed on Server PCs located at a Data Center. The Host PCs must connect with the Data Center to process transactions such as postage dispensing, meter registration, or meter refills. Transactions are requested by the Host PC and sent to the Data Center for remote processing. The transactions are processed centrally at the Data Center and the results are returned to the Host PC. Accounting for funds and transaction processing are centralized at the Data Center. See, for example, U.S. Patent No. 5,454,038, which is assigned to the assignee of the present invention. The Virtual Meter does not conform to all the current requirements of the IBIP Specifications. In particular, the IBIP Specifications do not permit PSD functions to be performed at the Data Center.

[0013] It has been found that an open metering system, which conforms to the IBIP Specifications, can be implemented on a conventional local area, or wide area, network to form a "Network PC Metering System". The Network PC Metering System includes a plurality of Client PCs operatively coupled to a Network Server PC as part of a conventional network. The Network PC Metering System is configured with at least one PSD coupled to at least one of the Client PCs, whereby authorized ones of the other Client PCs on the network can obtain postage value from a PSD that is remote from the requesting Client PC. Any Client PC may have one or more PSDs attached thereto. Each Client PC has access, if authorized, to both its own local PSD(s), if any, and any other Client PC's PSD(s) ("remote PSDs") in the network.

[0014] Each Client PC runs its own client metering application to dispense postage and to perform registration and refill operations. For each PSD in the Network PC Metering System, the Client PC to which the PSD is coupled controls processing transactions for dispensing postage and registration and refill of the PSD. When performing such operations, the Client PC functions as a server for the metering transaction, and is referred to

herein as a "Meter Server PC". In the Network PC Metering System the accounting for debits and credits to the PSD and the logging of transactions are performed on the Meter Server PC. Thus, the transaction processing is performed remotely when a Client PC is accessing a remote PSD. In alternate embodiments, the logging of transactions is performed on a network server to which the Client PCs are connected ("Network Server PC").

[0015] In one embodiment, modems or internet connections for accessing the Data Center are located in the Meter Server PC. In alternate embodiments, the modem may be located in the PSD or the Client PC and the Internet connection may be in the Client PC.

[0016] It has also been found that the Network PC Metering System can be configured such that each Client PC dynamically knows which remote PSDs are available for use by such Client PC, and that each Meter Server PC, i.e., each Client PC with a PSD coupled thereto, dynamically knows which Client PCs are on-line that are authorized to use the PSD coupled to the Meter Server PC.

[0017] There are several benefits that are realized from the present invention. One such benefit relates to the postal regulations requiring that the postage printed on a metered mailpiece must be obtained from a meter licensed from the local post office at which the mailpiece is deposited for mailing, commonly referred to as "origin of deposit" or "domain". With a plurality of PSDs accessible over a computer network a user at a Client PC is not limited to a single PSD having a single origin of deposit or domain. For example, while most users of a network metering system located in Shelton, Connecticut may be willing to deposit their mailpieces in the Post Office in Shelton, Connecticut, other users may intend to deposit their mailpieces at different origins of deposit, such as Stamford, Connecticut. Furthermore, some of the users may be at a Client PC that is physically located in Stamford, Connecticut but is connected to a network server physically located in Shelton Connecticut. The present invention provides each user of a Client PC on the network with access to several PSDs having different origins of deposit.

[0018] Another benefit of the present invention is that mailpiece generation does not have to be interrupted because of PSD funds limitation. For example, when a large mail run requires more postal value than is stored on a single PSD, the user can access another PSD on the network to complete the mail run without having to interrupt the mail run to refill the PSD that is low on funds.

[0019] The present invention provides a postage metering system that includes a plurality of printer modules connected as part of a network and operating as clients on the network. Postal security devices (PSDs) are coupled to the clients. Each PSD is local to the coupled client functioning as a host to the PSD and remote to the other of the plurality of clients. The PSD includes unique identification, postal value storage and a digital signature

generator. The clients function as a postage metering network wherein a client requests evidence of postage payment from a remote PSD for concluding postage metering transactions. Each of the clients determines which of the remote PSDs are available for metering transactions on the network by broadcast messages and requests. In one embodiment, a broadcast request for the identity of remote PSDs whose host is logged onto the network is sent over the network by a client when the client logs onto the network. Additional broadcast requests are periodically sent over the network by the client to other clients logged onto the network. Broadcast messages indicating the unique identification of the PSD coupled to a host are sent over the network by the host when the host logs onto the network. Additional broadcast messages are sent periodically over the network by the host. Another broadcast message indicating that a PSD is no longer available is sent over the network by the host when it logs off the network. In alternate embodiments a network server controls broadcast requests and messages.

[0020] In an open metering system, the printer modules are general purpose computers, such as personal computers. It has also been found that the present invention is also suitable for closed metering networks. In a closed metering system, the printer modules are postage meters, such as digital postage meters.

[0021] The above and other objects and advantages of the present invention will be apparent upon consideration of the following detailed description, taken in conjunction with accompanying drawings, in which like reference characters refer to like parts throughout, and in which:

Fig. 1 is a block diagram of a preferred embodiment of a Network PC Metering System with PSDs couple to Client PCs in accordance with the preferred embodiment of the present invention;

Fig. 2 (2A and 2B) are block diagrams of alternate embodiments of a Network PC Metering System with PSDs couple to Client PCs with a centralized transaction log;

Fig. 3 is a block diagram of another alternate embodiment of a Network PC Metering System with the PSD coupled to a network server;

Fig. 4 is a Client PC operating in stand-alone mode; Fig. 5 is a block diagram of the embodiment of a Network PC Metering System of Fig. 1 with a Client PC in Meter Server mode;

Fig. 6 is a flow chart of a Client PC accessing a remote PSD;

Fig. 7 is a flow chart of a Client PC/Meter Server broadcasting requests and messages to other Client PCs on the network; and

Fig. 8 is a block diagram of a closed system metering network in accordance with an embodiment of the present invention.

[0022] In describing the present invention, reference is made to the drawings, wherein there is seen in Figs. 1-3, three alternate embodiments of a Network PC Metering System. Fig. 1 shows one embodiment of the present invention.

A Network PC Metering System, generally designated 10, includes a plurality (five are shown) of Client PCs 20 conventionally coupled to a Network Server 30. Each PSD 40 (two are shown) of Network PC Metering System 10 is coupled to one of Client PCs 20. Each Client PC includes a conventional personal computer system with display, keyboard, and an unsecured printer 22. (Optionally, each Client PC may access a network printer 23 connected directly to the network.) Preferably, a plurality of PSDs exists in Network PC Metering System 10, with at least one PSD 40 being coupled to several Client PCs 20. When a specific PSD 40 is accessed for a metering transaction, Client PC 20, to which the PSD 40 is attached, becomes a Meter Server PC 21 (shown within parenthesis) for the remainder of the transaction. When the PSD 40 is being accessed by the Client PC 20 to which the PSD is coupled the Client PC 20 is functioning as a stand-alone PC meter. An example of a stand-alone PC metering system is described in European Patent Publication No. 0780809, filed December 19, 1996.

[0023] In the preferred embodiment, the postal funds accounting and the transaction processing occur in the Meter Server PC 21. It will be understood that this is a decentralized approach concerning funds accounting and transaction accounting because each Client PC 20 having a PSD 40 attached thereto maintains accounting information (departmental accounting registers 42) and transaction information (transaction logs 44) relating to transactions occurring only at its PSD 40.

[0024] Figs. 2A and 2B show alternate embodiments of the present invention. Network PC Metering System, generally designated 10', includes a plurality (five are shown) of Client PCs 20 conventionally coupled to a network server 30. Each PSD 40 (two are shown) of Network PC Metering System 10' is coupled to one of Client PCs 20. Each Client PC includes a conventional personal computer system with display, keyboard, and an unsecured printer 22 (and/or optional network printer 23). As in the preferred embodiment, a plurality of PSDs exists in Network PC Metering System 10', with at least one PSD 40 being coupled to several Client PCs 20. When the specific PSD is accessed for a metering transaction, the Client PC 20, to which the PSD 40 is attached, becomes a Meter Server PC 21 for the remainder of the transaction (Fig. 5). In this embodiment the postal funds accounting occurs in Meter Server PC 21 when the transaction has been concluded. However, the transaction processing occurs at Network Server 30. It will be understood that this is a decentralized approach concerning funds accounting because each Client PC 20 that has a PSD 40 attached thereto maintains accounting information (accounting registers 42) relating to transactions occurring only at its PSD. However, this

embodiment provides a centralized approach concerning transaction accounting because one of the Meter Servers 21 (Fig. 2A) or Network Server 30 (Fig. 2B) maintains transaction information (transaction logs 44) relating to transactions occurring at any PSD.

[0025] Fig. 3 shows a third embodiment of a Network PC Metering System, generally designated 10^a, in which at least one PSD 40 is coupled to a Network Server 30 and a plurality of Client PCs 20 are conventionally connected to the Network Server 30. Each Client PC includes a conventional personal computer system with display, keyboard, and an unsecured printer 22 (and/or optional network printer 23). All accounting occurs in PSD 40 and transaction logs 44 are stored in Network Server 30. An example such an embodiment is described in European Patent Publication No. EP-A-0780809, filed December 19, 1996. This embodiment comprises a Network Server 30 functioning as server for a conventional network, such as a local area network, and also functioning as Meter Server PC 21 with PSD 40 coupled thereto. Requests for indicia originate from and printing of indicia occur at a Client PC 20. However, funds accounting and transaction processing occur at Network Server 30. It will be understood that the Client PCs 20 may be connected to Network Server 30 by modem. It will further be understood that Network Server 30 may be located at a Data Center. It will be understood that this is a centralized approach concerning funds accounting and transaction accounting because the PSD coupled to Network Server 30 maintains departmental accounting (accounting registers 42) and transaction information (transaction logs 44) relating to transactions occurring only in Network PC Metering System 10^a.

[0026] Referring again to Figs. 1 and 2, Network PC Metering Systems 10 and 10^a are configured with one or more PSDs 40 coupled to one or more Client PCs 20. In such configurations, the Client PC 20 becomes a Stand-alone PC Meter when a metering transaction is processed locally on its coupled PSD 40. When operating as a Stand-alone PC Meter, such Client PC 20 performs the previously described metering transaction, acting as both the requesting Client PC and the Meter Server PC. As a Stand-alone PC Meter, Client PC 20 can only access the PSD 40 coupled to it. There is no remote vault access when a Client PC is processing a metering transaction on the local PSD.

[0027] Referring now to Fig. 4, a Client PC 20 is shown in Stand-alone PC Meter mode, generally designated 100. Stand-alone PC Meter 100 includes Host PC 102, PSD 104 and printer 106. Stand-alone PC Meter 100 processes the functions for PSD registration, PSD refill, and postage dispensing as transactions for PSD 104. Processing is performed locally by metering software component 110 (referred to herein as "PC Meter Toolkit") running in Host PC 102. In the preferred embodiment, PC Meter Toolkit is a Component Object Model/Distributed Component object Model (COM/DCOM)

object (typically implemented as a dynamic link library (DLL) or OLE control) with interfaces to perform metering operations. One such interface maintains a list of local and remote PSDs on the network. This interface 5 maintains a current list of all known and attached PSDs (the 'metertable') at the time it is instantiated. There is also a refresh method that Host and Client applications may use to update the list. An example of a PC metering system using a DLL with interfaces to perform metering 10 operations is described in previously noted European Patent Publication No. EP-A-0780809, filed December 19, 1996.

[0028] This Toolkit implementation allows Meter Servers to be local or remote without any changes in the Client PC interface. The PC Meter Toolkit and Meter Server could be within the same computer, computers connected via a local area network or the internet. Network protocol negotiation is handled, for example, by the Windows operating system. For additional information on 15 COM/DCOM see technical white papers for Microsoft Windows NT® Server, including: DCOM Architecture; DCOM Technical Overview; and DCOM The Distributed Component Object Model, A Business Overview.

[0029] PC Meter Toolkit 110 includes the following 20 components: a transaction handler, a vault interface, and a transaction log handler. Connections to the Data Center 5 can be made locally from the Stand-alone PC Meter 100 via modem 130. Accounting for debits and credits to the PSD are also performed locally, logging the transactions on the hard drive of Stand-alone PC 25 Meter 100. In this manner, the transaction processing and funds accounting are centralized on the Client PC operating as Stand-alone PC Meter 100.

[0030] Stand-alone PC Meter 100 may accommodate 30 more than one PSD per PC, for example, supporting one vault per serial port. Several Host or client applications programs 140, such as a word processor or an envelope designer, may access the PC Meter Toolkit 110 concurrently.

[0031] The PC Meter Toolkit 110 provides standard 35 metering functions, such as dispensing postage, PSD refills, and PSD registration. The PC Meter Toolkit 110 resides in all Meter Servers and remote Client PCs capable of printing postage. The user of Stand-alone PC 40 Meter 100 can access local or remote PSDs using PC Meter Toolkit 110. The PC Meter Toolkit 110 provides a list of the available PSDs from which the user selects a desired PSD for a particular transaction.

[0032] The COM/DCOM network concept provides 45 mechanisms for a remote Client PC to gain access rights to the PC Meter Toolkit component in a PC Meter Server. Optionally, every Client PC can be given access rights to the PC Meter Server, whereby the PC Meter Server's PSD PIN (password) can be used to authorize 50 access to postage functions in the PC Meter Server and its PSD. By default, all PSDs are considered remotely accessible by all Client PCs unless configured differently by the user. Alternatively, the list of available PSDs

can be customized based on user or system filters. For example, only sharing vaults whose origin zip matches the return address of the mail piece. In the preferred embodiment, the PSD is not active during access for authorization because PIN validation is performed by the PC Meter Server. The PC Meter Server obtains the PSD PIN from the PSD to perform validation. In an alternate embodiment, the PIN validation could occur within the PSD. This is a secure process because the PIN is stored in the PSD.

[0033] During the creation of a mailpiece, the user performs the following functions whether the PC meter is operated in stand-alone mode or network mode. The user can select CD-ROM addressing or dialup addressing (at the Data Center 5) to obtain correct addressee information. The user can choose the class of mail service (rate category) for the mailpiece. The user can select from a list of rate categories that are authorized by the Post Office. The user can view an indicium on the monitor while designing the mailpiece and print preview the mailpiece with an indicium image. PC Meter Toolkit 110 provides a method to draw the indicium image and 2D bar code before printing. The indicium may be marked as visible or invisible for display purposes. See U.S. Patent Application Serial No. 08/922875, entitled METHOD FOR PREVENTING FRAUDULENT PRINTING OF A POSTAGE INDICIUM DISPLAYED ON A PERSONAL COMPUTER filed September 3, 1997 and assigned to the assignee of the present invention, which discloses a method for preventing fraudulent printing of a postage indicium displayed on a personal computer. The user can change the postage amount, class of service and date of mailing. These changes are reflected in the indicium image.

[0034] PC Meter Toolkit 110 provides postal funds security because the user can not print an indicium without accounting for a debit to the PSD. Furthermore, there is no direct access to the indicium image, except through the PC Meter Toolkit transactions. The PC Meter Toolkit uses atomic transactions to tie the debit to PSD with the enabling of printing of the indicium image. The atomic transaction ensures that the debit to the PSD is complete before printing the indicium.

[0035] The transaction log stores funds transactions for PSD dispensing and refills. For Network PC Metering System 10, each Client PC stores the daily transaction log file for its local PSD(s). The user may select the local drive and directory path for the log file. For Network PC Metering System 10', each Client PC forwards transaction information for its local PSD(s) to Network Server 30 which stores the daily transaction log file. Once the accounting for a mailpiece transaction is completed, the client application requesting the transaction spools the mail piece corresponding to the transaction to the PC print manager for printing the indicium.

[0036] Network PC Metering System (10 or 10') has many Client PC's with or without PSD(s) attached. Each Client PC has access to both its own local PSD(s) and

remote PSDs in the network. Each Client PC can run its client application to dispense postage and initiate registration and refills.

[0037] As previously stated, Network PC Metering System (10 or 10') processes transactions for dispensing postage, PSD registration, and PSD refill on the Client PC 20 where the specific PSD 40 is located. This requires the transaction processing to be performed remotely if the user is accessing a remote PSD. Modems for accessing Data Center 5 are preferably located on each Client PC 20 having a PSD 40 coupled thereto.

However, a single modem may be located on the Network Server 30 instead of several modems on each Client PC 20 having a PSD 40 coupled thereto. In this manner, PSD registrations, and PSD refills are processed through Network Server 30.

[0038] The software components for the Network PC Metering System (10 or 10') include the software components for the Stand-alone PC Meter along with two additional components, listed below.

[0039] Referring now to Fig. 5, a Client PC 20 enters Meter Server PC 21 mode when another Client PC 20 on the network initiates remote access of PSD 41 through its PC Meter Toolkit 110. Meter Server PC 21 processes the functions for PSD registration, PSD refill, and postage dispensing as transactions for PSD 41. Processing is performed at Meter Server PC 21 by the previously described PC Meter Toolkit 110 residing in Meter Server 21 and at Client PC 20 by the PC Meter Toolkit 110 residing in Client PC 20.

[0040] Using a DCOM implementation, the PC Meter Toolkits 110 residing in the Client PC 20 and the Meter Server 21 operate in conjunction with each other such that the remote requesting Client PC 20 and Meter Server PC 21 operate collectively as a PC meter regardless of PSD/Toolkit location. The PC Meter Toolkit 110 residing in Meter Server 21 handles messages from and to the requesting Client PC 20, and handles standard metering functions, such as dispensing postage, PSD refills, and PSD registration, for PSD 41 in the same manner as when in stand-alone mode.

[0041] Referring now to Fig. 6; at step 200, Client PC 20 sends a request through its PC Meter Toolkit 110 to remote PSD 41 for postal value for a mailpiece. At step 205, Meter Server 21 determines whether the Client PC 20 is authorized to make the request. If not authorized, then at 210, Meter Server 21 responds to Client PC 20 that it is not authorized to access PSD 41. If authorized, then at step 215, Meter Server 21 processes the request through its PC Meter Toolkit 110 sends the request to PSD 41 with information received from remote Client PC 20. At step 220, PSD 41 dispenses the requested postal value including a digital signature based on the request. At step 225, PSD 41 sends the digital signature and transaction information to Meter Server 21. At step 230, Meter Server 21 through its PC Meter Toolkit 110 records the transaction information in a transaction log on its hard drive. At step 235, Meter Server 21 sends

the digital signature and at least some of the transaction information to remote Client PC 20. At step 240, Client PC 20 receives the digital signature and transaction information and, at step 245, Client PC 20 generates an indicium bitmap and prints the indicium including digital signature on mailpiece.

Networked Operations

[0042] Microsoft's Windows 95 and Windows NT™ operating systems provide facilities through DCOM and other mechanisms to implement network communications. Through the use of DCOM, objects can communicate via a mechanism referred to as connection points, which can be used to implement direct communication, multi-casting (more than one client receives messages), or broadcasting (all clients receive messages). This can be done between processes on the same computer or multiple computers on a network or on the internet. Mailslots is another Windows mechanism that permits the same communications facilities. The PC Meter Toolkit 110 uses these facilities to exchange information about the location and disposition of PSDs on the network.

[0043] When a Client PC logs into the network, the PC Meter Toolkit 110 running on the Client PC registers the necessary connection points; one common to all PC Meter Toolkits on the network, and one specific to the Client PC itself. The common connection point is used to send and receive multi-casted messages from all Clients. The specific connection point is for messages intended solely for one particular Client PC Meter Toolkit, such as a request or response for evidence of postage payment.

[0044] Upon initialization, the Client PC's PC Meter Toolkit 110 uses the common connection point to send a message for all other PC Meter Toolkits to respond with available PSDs. PC Meter Toolkits running on PC Meter Servers 21 then respond to the Client PC's specific connection point with information about the location and identities of any attached PSDs. Referring to figure 2A, the list of available PSDs is consolidated and presented to applications that require postage metering functions. Referring to Figure 2B, the list of available PSDs is consolidated along with locally attached PSDs and the complete list presented to applications that require postage metering functions. In this case, the PC Meter Toolkit 110 also sends messages to the common PC Meter Toolkit connection points indicating that another PSD is available for use by other PC Meter Toolkits.

[0045] When a remote Client PC 20 selects a PSD 40 to use, the PC Meter Toolkit 110 uses the information collected at initialization to know where the particular PSD is located, and how to communicate with it.

[0046] In operation, the PC Meter Toolkit 110 also handles messages regarding the status of PC Meter Toolkits 110 on the network. Should new PC Meter

Toolkits be started on other Client PCs 20, the local PC Meter Toolkit responds with information regarding any attached PSDs 40. Should messages be received indicating that a new PC Meter Client 20 has come on-line with its own PSD(s) 40, the PC Meter Toolkit updates its list of available PSDs. Similarly, if a Client PC 20 is shutting down, messages are sent to all Client PCs indicating that any local PSDs will no longer be available. It is noted that all messages between PC Meter Toolkits 110 can be encrypted for added security.

[0047] The effect of the Client PC Startup and Shutdown multi-casts is that all Client PCs 20 dynamically know exactly which PSDs 40 are available. Clients also have the ability to ask explicitly for a refreshed list of available PSDs 40 since it is possible that a machine can go off-line without proper notification. DCOM also provides mechanisms for this with continual pinging to catch computers improperly notifying clients/servers.

[0048] Referring now to Fig. 7, at step 400, a Client PC starts up and queries for local PSDs at step 402. If local PSDs are available, Client PC is also a Meter Server for the local PSDs. At step 404, PC Meter Toolkit 110 in the Client PC creates mailslot connection points in the Client PC. When the Client PC detects the presence of a network, at step 406, then PC Meter Toolkit 110 broadcasts a message, at step 408, for the availability of its local PSD(s), if previously detected, and, at step 410, broadcasts a request for the identity and location of remote PSDs available on the network. The broadcast request is repeated whenever a periodic time has elapsed at step 412. This ensures that the Client PC is updated with information on the current available remote PSDs on the network. When Client PC receives, at step 414, a response to its requests or receives messages from other Client PCs identifying remote PSDs on the network, then at step 416, PC Meter Toolkit 110 builds / modifies a list of available PSDs on the network. At step 418, if the Client PC is a Meter Server with a local PSD and it logs off the network, i.e.; powers down, the Client PC broadcasts its logoff which advises the other Client PCs that its local PSD is no longer available on the network. At step 420, PC Meter Toolkit 110 in the Client PC destroys the mailslot connection points in the Client PC.

Centralized vs. Distributed Processing On the Network

[0049] A PC Metering system must account for funds for all mail pieces and refills. This requires saving transaction records in a sequential transaction log file. Both postage dispensing and refills should be kept in the same sequential file such that meter discrepancies, such as discrepancies due to meter movement between Client PCs on the network, can be reconciled. The following paragraphs summarize the impact of using centralized vs. decentralized accounting for the transaction log on a network metering system.

[0050] In a network metering configuration, if accounting for funds is summarized by a user, transactions

could be logged where the user is located. This would require consolidating log files only if the user has more than one PC at which transactions can be initiated, i.e., the user moves between PCs). This method uses decentralized accounting, logging transactions on the user's PC.

[0051] If accounting for funds is summarized by a meter, transactions should be logged where the meter, i.e. the PSD, is located. This would require consolidating log files only if the PSD could be attached to any PC (PSD moves between PCs). This method uses decentralized accounting, logging transactions on the PSD's PC.

[0052] If accounting for funds is summarized by department (i.e. departments have several users that can access several PSDs), transactions must be consolidated if the logging of transactions was performed where the user is located or where the PSD is located.

[0053] An alternative to such consolidation of log files from PCs is a centralized accounting and logging of all transactions on same PC or a centralized server. Transactions would have to be sent to the Network Server PC for every mail piece, producing heavy network traffic. If the centralized server is down, or otherwise not available, then no postage dispensing or refills can occur, disabling metering capabilities over the entire network. A centralized server for Network PC Metering System is not the preferred embodiment of the present invention.

[0054] Network PC Metering Systems 10 and 10' are representative of distributed processing of the metering transaction. Network PC Metering System 10 involves local transaction processing requested by a requesting Client PC 20, and remote accounting and logging at the Meter Server PC 21, i.e., where the PSD 40 and transaction log file 44 are located. Network PC Metering System 10' involves local transaction processing by the requesting Client PC 20, remote accounting at the Meter Server PC 21, i.e., where the PSD 40 is located, and remote logging at the Network Server 30, i.e. where transaction log file 44 is located. Thus, the transaction processing is split from the accounting functionality in distributed processing. The steps of the transaction are split between different PCs of the network.

[0055] There is an advantage to configuring network metering for distributed processing, such as In Network PC Metering Systems 10 and 10'. If Network Server 30 is down, metering transactions may still be performed when Client PCs having PSDs coupled thereto operate in stand-alone mode. Furthermore, network-metering transactions may be performed even when a Client PC 20 with a PSD attached thereto is not logged on the network. For example, the Client PC not logged on the network can operate in stand-alone mode, and the Client PCs logged on the network can access other Client PCs having PSDs coupled thereto.

[0056] When a Client PC is attempting to access remote PSDs on the network, an optional prioritized list of available PSDs can be displayed to the user for selection. The prioritized ordering of the available PSDs may

use the following heuristics:

1. PSDs sharing the same ZIP as the originating address of the mailpiece
2. Local PSDs (same location as the Client PC)
3. Remote PSDs sharing the same origin ZIP as the local PSDs
4. PSDs having the same three digit ZIP as items 1-3
5. Remaining PSDs

[0057] The preferred embodiment of the present invention has been described based on a Windows operating system for the Client computers. It will be understood that the present invention is suitable for use with any computer operating system. It will further be understood that although the embodiments of the present invention are described as postage metering systems, the present invention is applicable to any value metering system that includes transaction evidencing, such as monetary transactions, item transactions and information transactions.

[0058] The preferred embodiment has been described for an open system metering network. It will be understood that the present invention applies also to a closed system metering network wherein digital postage meters are used in place of the Client PCs described in the preferred embodiment. Such a closed system metering network is shown in Fig. 8. A Network Metering System, generally designated 510, includes a plurality (five are shown) of Client modules 520 conventionally coupled to a Network Server 530, such as a personal computer. The Client modules are digital printers that are dedicated to printing postage indicium. Each Client module resembles a conventional digital metering system with optional display, keyboard, and a printer 522, however, some of the Client modules do not have an accounting module or PSD attached thereto. Preferably, a plurality of PSDs 540 (two are shown) exists in Network Metering System 510, with at least one PSD 40 being coupled to several Client modules 20. The PSDs 540 are accounting modules similar to accounting units in conventional electronic postage meters. When a specific PSD 540 is accessed for a metering transaction, the Client module 520, to which the PSD 40 is attached, becomes a Meter Server 521 (shown within parenthesis) for the remainder of the transaction. When the PSD 540 is being accessed by the Client module 520 to which the PSD is coupled the Client module 520 is functioning as a conventional meter. A more detailed description of a closed system metering network is provided in previously noted European Patent Application Nos. (Client Ref.: E-648), (Attorney Ref.: 76 396).

[0059] While the present invention has been disclosed and described with reference to the embodiments thereof, it will be apparent, as noted above, that variations and modifications may be made therein. It is, thus, intended in the following claims to cover each var-

iation and modification that falls within the true spirit and scope of the present invention.

Claims

1. A postage metering system comprising:

a plurality of printing means (22) operatively connected as part of a network (10) and operating as client printing means on the network, the client printing means including processor (20), memory and storage means;
 a plurality of postal security devices (40) (PSDs), each of the PSDs being coupled to one of the client printing means (20, 22), the PSD (40) being local to the coupled client printing means functioning as a host to the PSD and remote to the other of the plurality of printing means, the PSD including unique identification, postal value storage means and digital signature means;
 means in the client printing means for functioning as a postage metering network wherein a client printing means is arranged to request evidence of postage payment from a remote PSD for concluding postage metering transactions; and
 means in each client printing means for determining which of the remote PSDs are available for metering transactions on the network.

2. The system of claim 1 wherein the determining means comprises a broadcast request sent over the computer network by first client printing means when the first client printing means logs onto the network, the broadcast request being for the identity of remote PSDs coupled to a host that is logged onto the network.
3. The system of claim 1 or 2 wherein each host is operable to function as a meter server (20) for metering transactions between the other clients and the PSD coupled to said each host.
4. The system of claim 3 wherein means are provided to store in the meter server transaction information received from the PSD for each metering transaction.
5. The system of any one of the preceding claims wherein the determining means comprises a broadcast request periodically sent over the network by first client printing means to other client printing means logged onto the network, the broadcast request being for the identity of remote PSDs (40)

coupled to a host logged onto the network (10).

6. The system of any one of claims 1 to 4 wherein the determining means comprises a broadcast message sent over the network by a host of a PSD when the host first logs onto the network, the broadcast message including the unique identification of the PSD coupled to the host.
7. The system of any one of claims 1 to 4 wherein the determining means comprises a broadcast message sent periodically over the network by a host of a PSD, the broadcast message including the unique identification of the PSD coupled to the host.
8. The system of any one of claims 1 to 4 wherein the determining means comprises a broadcast request periodically sent by a network server to all client printing means logged onto the network, the broadcast request to each of the client printing means logged onto the network for the identity of the PSDs coupled to the client printing means.
9. The system of claim 8 wherein the client printing means are arranged to find available PSDs through the network server.
10. The system of any one of claims 1 to 4 wherein the determining means comprises a broadcast message sent over the network by the client printing means having a PSD coupled thereto when the client printing means logs off the network, the broadcast message indicating that the PSD coupled thereto is no longer available.
11. The system of any one of the preceding claims wherein each of the client printing means are limited to accessing only certain ones of the PSDs.
12. The system of claim 11 wherein first client printing means functions as a meter server for first metering transactions between the other client printing means and the local PSD coupled to the first client printing means, the other client printing means functioning as a meter client on the postage metering network for the first metering transactions.
13. The system of claim 12 wherein the meter server determines whether the client printing means is authorized to request postage from the PSD.
14. The system of claim 12 wherein the PSD determines whether the client printing means is authorized to request postage from the PSD.
15. The system of any one of the preceding claims wherein the printing means are personal computers.

16. The system of any one of claims 1 to 14 wherein the printing means are meter printers.
17. A postage metering system comprising:
- a plurality of general purpose computers (20) operatively connected as part of a computer network (10) and operating as client computers on the computer network, the client computers including processor, memory and storage means; 10
- a plurality of postal security devices (PSDs) (40), each of the PSDs being coupled to one of the client computers (20), the PSD being local to the coupled client computer functioning as a host computer to the PSD and remote to the other of the plurality of computers, the PSD including unique identification, postal value storage means and digital signature means;
- means in the client computers for functioning as a postage metering network wherein a client computer is operable to request evidence of postage payment from a remote PSD for concluding postage metering transactions; and
- means in each client computer for determining which of the remote PSDs are available for metering transactions on the computer network.
18. The system of claim 17 wherein the determining means comprises:
- a broadcast request sent over the computer network by a first client computer when the first client computer logs onto the computer network and periodically thereafter, the broadcast request requesting the identity of each remote PSD coupled to a host computer logged onto the computer network; 30
- a broadcast message sent over the computer network by each host computer when said each host computer logs onto the computer network and periodically thereafter, the broadcast message indicating the unique identification of the PSD coupled to said each host computer; and
- a broadcast message sent over the computer network by said each host computer when said each host computer logs off the computer network, the broadcast message indicating that the PSD coupled thereto is no longer available. 35
19. The system of claim 17 or 18 wherein the determining means comprises a broadcast request periodically sent by a network server to all client computers logged onto the computer network, the broadcast request requesting that each of the client computers logged onto the network and functioning as a host computer identify each PSD coupled thereto, wherein the client computers find available PSDs 40
- 50
- through the network server.
20. The system of any one of claims 17 to 19 wherein said each host computer functions as a meter server for metering transactions between the other client PSDs and the PSD coupled to said each host computer and the other client computers function as meter clients on the postage metering network, wherein transaction information received from the PSD for each transaction request is stored in the meter server.
21. The system of claim 20 wherein the meter server is operable to determine whether the client computer is authorized to request postage from the PSD. 15
22. The system of claim 20 wherein the PSD is operable to determine whether the client computer is authorized to request postage from the PSD.
23. The system of any one of claims 17 to 22 wherein each of the client computers is limited to accessing only certain ones of the PSDs. 20
24. A transaction evidencing system comprising:
- a plurality of general purpose computers (20) operatively connected as part of a computer network (10) and operating as client computers on the computer network, the client computers including processor, memory and storage means, and at least some of the client computers including transaction evidencing software that selectively runs on the client computers; 25
- a plurality of postal security devices (40) (PSDs), each of the PSDs being coupled to one of the client computers (20), the PSD being local to the coupled client computer functioning as a host computer to the PSD and remote to the other of the plurality of computers, the PSD including unique identification, digital signature means and transaction accounting means;
- means in the client computers (20) for functioning as a transaction evidencing network wherein a client computer requests and obtains transaction evidencing from a remote PSD (40) for concluding transactions at the requesting client computer; and
- means in each client computer for determining which of the remote PSDs are available for transactions on the computer network and the identification of each client computer coupled to the available PSDs. 30
25. The system of claim 24 wherein the determining means comprises:
- a broadcast request sent over the computer
- 35
- 40
- 45
- 50
- 55

- network by a first client computer when the first client computer logs onto the computer network and periodically thereafter, the broadcast request requesting the identity of each remote PSD coupled to a host computer logged onto the computer network; 5
 a broadcast message sent over the computer network by each host computer when said each host computer logs onto the computer network and periodically thereafter, the broadcast message indicating the unique identification of the PSD coupled to said each host computer; and a broadcast message sent over the computer network by said each host computer when said each host computer logs off the computer network, the broadcast message indicating that the PSD coupled thereto is no longer available. 10
 15
26. The system of claim 24 or 25 wherein the determining means comprises a broadcast request periodically sent by a network server to all client computers logged onto the computer network, the broadcast request requesting that each of the client computers logged onto the network and functioning as a host computer identify each PSD coupled thereto, wherein the client computers find available PSDs through the network server. 20
 25
27. The system of claim 24 or 25 wherein said each host computer is operable to function as a transaction evidencing server for transactions between the other client computers and the PSDs coupled to said each host computer and the other client computers are operable to function as transaction evidencing clients on the computer network, wherein transaction information received from the PSD for each transaction request is stored in the transaction evidencing server. 30
 35
28. The system of claim 27 wherein the transaction evidencing server is operable to determine whether the client computer is authorized to request transaction evidencing from the PSD. 40
29. The system of claim 27 wherein the PSD is operable to determine whether the client computer is authorized to request transaction evidencing from the PSD. 45
30. The system of any one of claims 24 to 29 wherein each of the client computers is limited to accessing only certain ones of the PSDs. 50
31. A method for automatic detection of remote postage security devices (40) (PSDs) on a network (10) having a plurality of client devices (20) to which the PSDs are coupled, the method comprising the steps of:
 55
 broadcasting (410) a request over the network (10) by a first client device (20) when the first client device logs onto the network, the request requesting the identity of each remote PSD (40) coupled to the other of the plurality of client devices (20) which are functioning as a host to the PSD and are logged onto the network; periodically thereafter rebroadcasting the request;
 broadcasting (408) a first message over the network by each host when said each host first logs onto the network, the first message indicating the unique identification of the PSD coupled to said each host;
 broadcasting (420) a second message over the network by said each host when said each host logs off the network, the second message indicating that the PSD coupled thereto is no longer available; and maintaining (416) a list of PSDs available on the network.
